

Spotly — Data Model

UML Class Diagram

Course: ISS296 — Spring 2026
Instructor: Mr. Amine Ben Hassouna
Team: Cyrine Krichen, Eya Sassi,
Lina Khemiri, Youssef Ben Jemaa

Overview

The Spotly data model consists of **eight entity classes** persisted in the browser's local storage. Each class has a dedicated storage key and follows a reactive CRUD pattern. There is no backend: the application is entirely frontend-driven and data is shared across browser tabs via the Web Storage **storage** event.

The diagram uses standard UML class notation. Relationships show the foreign-key field used for association (e.g. **venueId**, **userId**). Composition arrows (*filled diamond*) indicate that child objects have no independent existence outside their parent.

Persistence keys:

Class	Storage Key	Notes
User	spotly_users	Email used as natural key
Venue	spotly_venues	Linked to User via adminEmail
Environment	spotly_environments	Contains embedded FloorElement array
MenuItem	spotly_menu_items	Scoped to venue; optionally to specific environments
Reservation	spotly_reservations	Status: REQUESTED APPROVED REJECTED CANCELLED CHECKED_IN COMPLETED NO_SHOW
Review	spotly_reviews	Status: VISIBLE HIDDEN
VenueStaff	spotly_venue_staff	Junction table linking User to Venue as staff
WaiterCall	spotly_waiter_calls	Status: pending acknowledged
